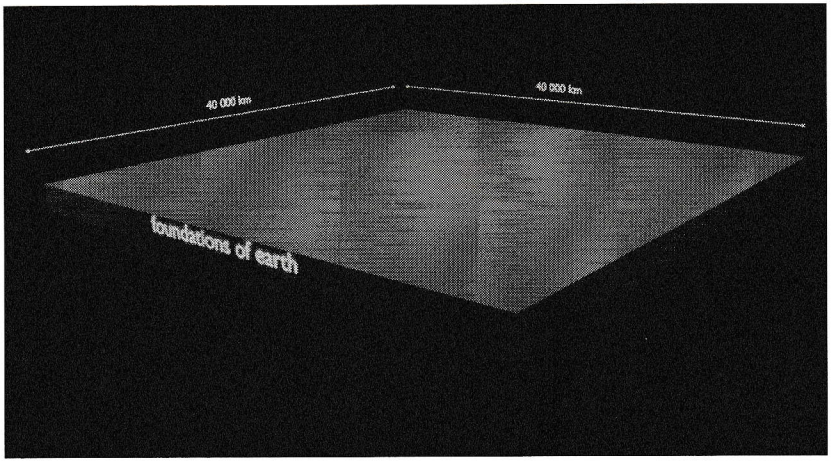
CHAPTER 2

Foundation of the Earth and the Aether

"For before any visible things had come into existence, I, the ONE, moved around in the invisible things, like the sun, from the east to the west and from west to east. But the sun has rest in himself, yet I did not find rest, because everything was not yet created. I though up the idea of establishing a foundation, to create a visible creation."

The Second Book Of Enoch



Pic.1

The Foundations of Earth are mentioned many times throughout the Old Testament, since they play the key role in ancient cosmology, including in ancient Egypt. Since the establishment of the heliocentric model, all knowledge surrounding the true shape of the Earth went lost and was substituted with fictitious round Earth beliefs. The Old Testament and The Book of Enoch are currently the only source available to provide us an insight into the cosmology of the Ancients. Many people today think that verses like :

"Which shaketh the earth out of her place, and the pillars thereof tremble. "

Job 9 : 16

..show scientific ignorance and fundamental misconception concerning the shape of the Earth. Truth is, it's rather our modern misconceptions and lack of insight into the ancient knowledge that prevents us from seeing the deep understanding of reality that was prevalent in the ancient world, and that fortunately was preserved to this day in scriptures. Most people today associate the ancient "Pillars of the Earth" with columns to keep the disc shaped plane from falling down, but in the ancient worldview, the pillars were not mere columns supporting the Earth, but the foundation and base for the entire universe. Before God created anything, he first laid the foundation for a visible Creation.

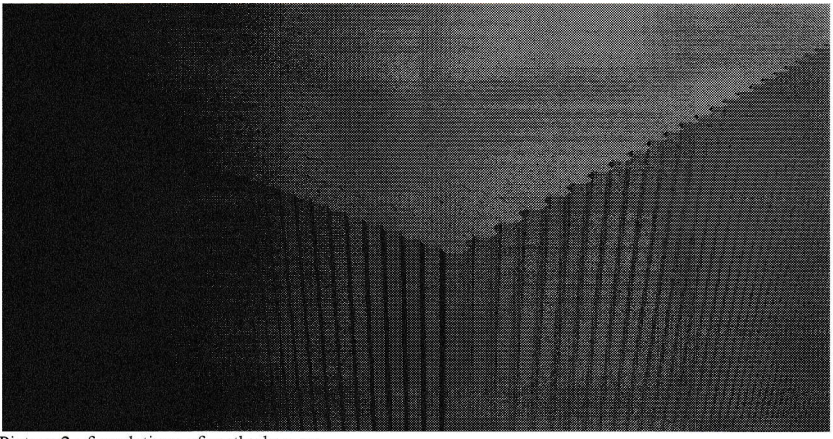
*"Where wast thou when I laid the **foundations of** the **earth**? declare, if thou hast understanding. "*

"Who hath laid the measures thereof, if thou knowest? or who hath stretched the line upon it?"

„Whereupon are the foundations thereof fastened? or who laid the corner stone thereof;"

Job 38 : 4-6

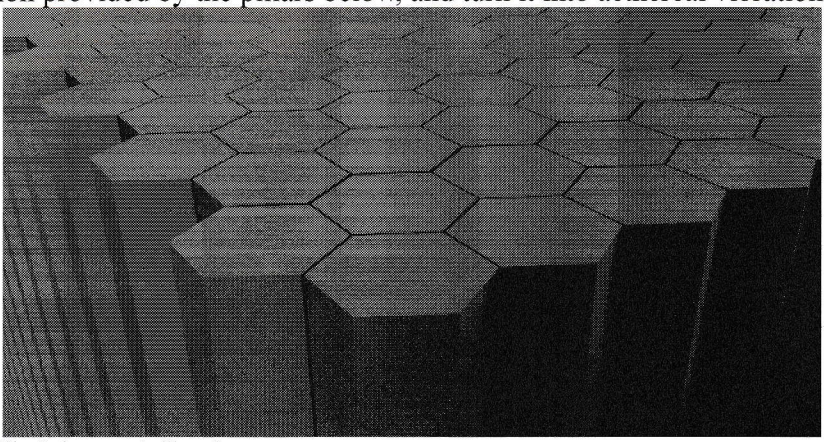
The pillars of the Earth represent the foundation for the entire created universe. Their main function is to provide a high-frequency vibration/energy, as the pillars below are the "source" of all energy in the universe.



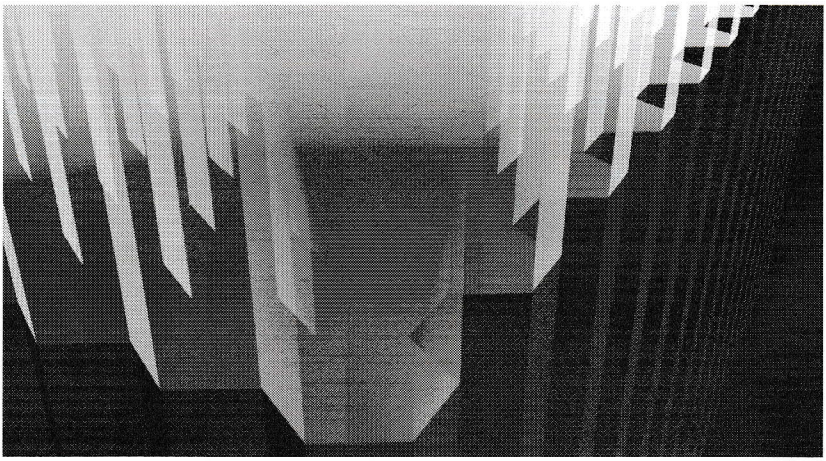
Picture 2 : foundations of earth close up

The pillars are vibrating at a very high frequency. This frequency is conducted and distributed throughout the entire universe by the aether. The aether is a non-

physical fabric which suffuses the entire universe and permeates everything within. The primary function of the aether is to conduct the high-frequency vibration provided by the pillars below, and turn it into aethereal vibration.



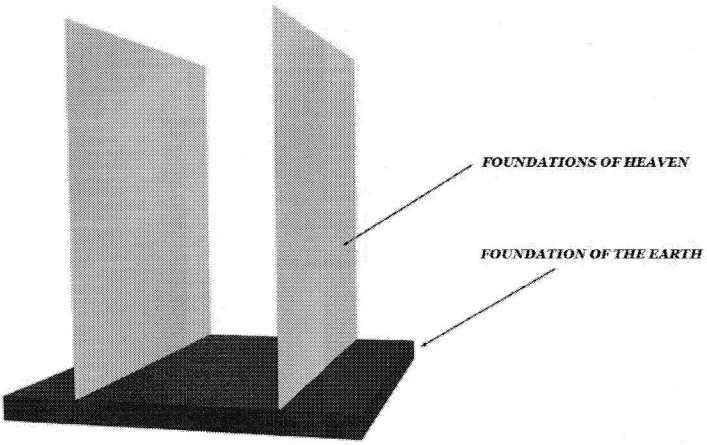
Pic. 3 : hexagonal pillars close up



Pic.4 : aether

The pillars of the Earth represent hexagonal columns of approximately, if not precisely, one foot (30,48 cm) in diameter. Each of the pillars is vibrating at a very high frequency. But the vibration cannot be conducted without a medium, and this is where the aether comes into play. Like the foundation of the Earth, the aethereal body is made up of hexagonal pillars which are adjoined with the pillars of the Earth. The pillars of the aether conduct the vibration and distribute it throughout the universe. Aethereal vibration is also the force behind "gravity" - matter strives towards the source of vibration, which is downwards, towards the pillars of the Earth.

Foundations of Heaven



Pic.5 : foundations of heaven

The Foundations of Heaven represent two walls running along the latitudes 90°. Their altitude and length is 40 075 km. Their main function is to provide additional vibration, and to create platforms between them, similarly to bookshelves. The Earth is situated on one of the platforms between the two foundations. Another function of the Foundations of Heaven is to radiate an aethereal frequency that bends light from the stars, planets, Sun and moon thus creating the optical illusion of circular movements. All luminaries and all stars are running from east to west in a straight line; it's the Foundations of Heaven that bend their light and bring about the two celestial poles at latitudes 90°.

What is Visible Light?

Our modern concept of light is rather simple: A substance emanating from the light source, distributing in space, and illuminating the surrounding objects. The original concept of light is a little bit more complex. Visible light is a geometric fiber which vibrates at a low frequency or at a high frequency; the higher the frequency, the brighter it is. The fiber of visible light can be compared to a guitar string - as long as the string is static, it does not produce sound; as soon as it gets set in vibration, it produces a tone which distributes in space and increases towards the source, in this case the string. Similarly, visible light is not visible as long as the vibration of the fiber does not exceed a certain frequency; as soon as the frequency is high enough, light becomes visible.

Visible light is only one of several categories of light that we're going to be dealing with. We're going to examine visible light, aethereal light, and the domains.

The Categories of Light

1. **Visible light** : Visible light is an inseparable attribute of matter. Every object and every atom has a light body. The light body represents a geometric fiber. The fiber can either be vibrating at a high frequency and radiate visible light, or it can be vibrating at a low frequency, in the latter case, the given object is dark. Our perspective, including horizon line, is a constant interplay between the light body of our eyes and the surrounding light bodies. All visual information exchange between matter, as well the exchange and transfer of energy between matter in the form of heat, is provided by the fabric of the light body. The vibration of the fabric produces light, while the absence of vibration is darkness.

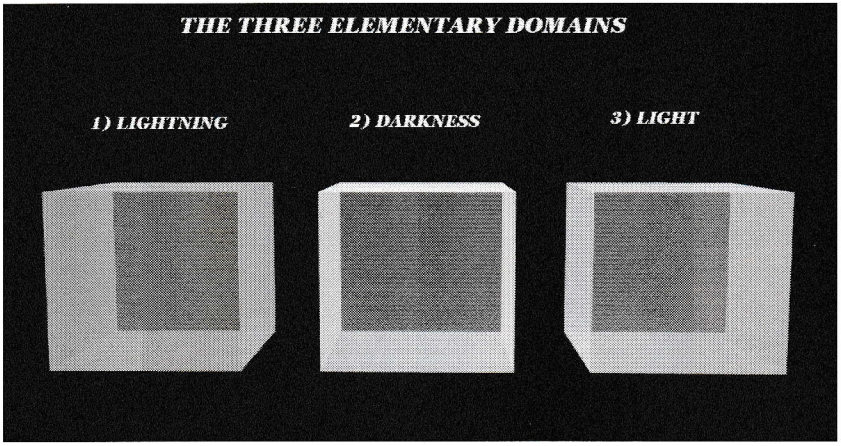
2. **Aetherial light** : The aether is a non-physical, geometric fabric/medium which suffuses the universe and permeates everything within. The aether is in a state of constant vibration, as it conducts the vibration of the pillars below. All matter strives downwards, towards the source of vibration (gravity is aethereal vibration). In other words, the pillars of the Earth are the generators of all energy in the universe, while the aether is the medium to distribute this energy throughout the universe.

3. **The domains of the three elements** : There are three elements in the universe : 1) **Light** (spiritual matter), 2)**Darkness** (solid, "physical" matter), and 3) **Lightning**. Each element represents a non-physical, geometric, cube-shaped body which suffuses the entire universe and occupies the same space as the aether. In fact, it's the domain which makes up space as we know it.

   All three domains simultaneously occupy the same space. The main function of the domains is to provide matter and to be the medium for matter. When the fiber of the a domain is exposed to vibration, it contracts and releases geometric bubbles; these bubbles are also known as atoms. Each of the three domains has its own specific geometric alignment. The "bubbles" (atoms) can only exist and move within their own domain. To understand this principle, let's imagine bubbles in water. Conventional bubbles cannot exist outside of water.

Similarly, atoms (of all three elements) cannot exist outside of their domain.

Elementary Domains



Pic.6

Each of the three domains depicted in picture 6 is a cube-shaped, non-physical body which is comprised of a geometric medium. When exposed to vibration, the medium contracts and releases geometric atoms, or "bubbles." Atoms can only manifest as hollow spaces within their corresponding domain. Each domain has its own specific geometric alignment which is bound to a certain geometry - for example, one domain releases atoms of octahedral shape; the other releases atoms of octagonal shape. However, the domains do not provide the physical laws necessary for physical processes to take place. This is where the aether comes into play. All three domains are overlaid over the aether and occupy the same space. The dimension of the domains is 40 075 km * 40 075 km * 40 075 km. It's aether which provides all the physical laws and forces necessary for the particles to move and to interact with the environment. Another important property of the domains is their repetitive nature. A particle which crosses the limit of the cube-shaped domain appears on the opposite side of cube without experiencing a boundary. In other words, particles can move in a straight line perpetually without ever reaching the wall. A particle that reaches the wall continues its motion and comes out on the opposite wall.

A particle is omnipresent within its domain; a manifestation of the atom is an expression of the contracted medium itself, with atoms being hollow spaces which are void of the medium. Therefore, the atom is not bound to any specific location and can manifest at any given point within its domain. This is what

happens when a particle reaches the end of the domain - it simply continues its motion in an infinite space loop, while experiencing space, or rather its domain, as an infinite continuum.

The Domain of Darkness

"I called out a second time unto the very lowest things, and I said, 'Let one of the invisible things come out visibly, solid. ' ***And Arkhas came out, solid, heavy and very black****. I said, 'Open yourself up, Arkhas, and let what is born from you become visible!' And he disintegrated himself.* ***There came out and age, dark, very large, carrying the creation of all lower things.*** *And I saw how good it was."*

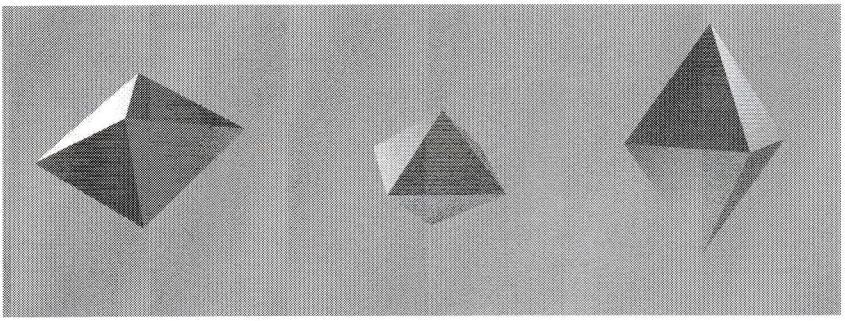
Darkness is solid matter which makes up our physical world. Every atom on the periodic table is a bubble in the domain of Darkness.

"I said to him, 'Come down low and ***become solid****! And become the foundation of the lowest things.!' And it came about.* ***And he came down and became solid.*** *And he became the* ***foundations of the very lowest things.*** *And there is nothing lower than Darkness except nothing itself."*

The Second Book Of Enoch

We are used to taking matter for granted, and assume that all matter around us

is in its natural, solid, and unchangeable state. In reality, there is no such thing as "a natural state of matter". Atoms are the product of a contraction of the medium Darkness. If the medium expanded back to its natural, non-contracted state, all matter around us, including we ourselves, would instantly vanish without leaving behind a trace of prior existence. All atoms are nothing but geometric bubbles within the fabric of Darkness. The difference between the elements on the periodic table is in the size and elongation of the bubbles. Aside from that, all atoms of Darkness have the same octahedral base, which we will discuss later.



Pic.6 : atoms

Picture 6 shows atoms of Darkness, also known as physical matter.

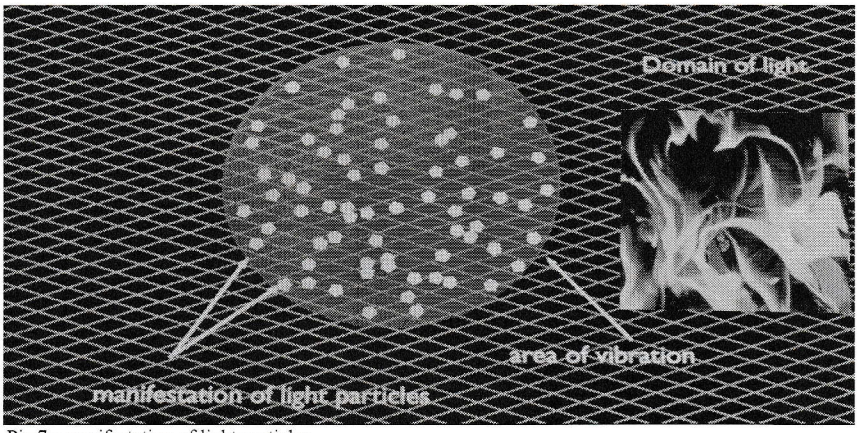
The Domain of Light

"I placed for myself a Throne and sat down on it. Then, to the Light, I spoke : "You go up higher than the Throne, and be solidified much higher than the throne, and become the foundation for the highest things." There was nothing higher than the Light except nothing itself. And again I bowed myself, and I looked upward from my Throne. "

The Second Book Of Enoch

Like Darkness, Light is another self-sufficient element. Light is the foundation of the heavenly and spiritual things, as Light represents "spiritual matter". We cannot perceive Light in our realm, since the vibration on Earth separates Light and Darkness; in other words, there is no interaction between these two elements down on Earth. Nevertheless, we can see Light temporarily manifest in the form of flames. Everyone who has ever brushed with the finger against a flame may have noticed that it has a perceptible density and the characteristics of soft matter. If you try to grip the flame of a candle with your fingers, you can sense a resistance to deformations, similar to the resistance of liquids that have

the viscosity of water or higher, for example, gasoline. Similarly, flames have a relatively high "viscosity". Although flames are perceived hot, it's not the flame itself which produces heat, but it's the frequency of the aether that causes the exothermic reaction. An exothermic reaction is a physical process in which an element, under the influence of high vibration, begins to decompose in a chain reaction. Does the vibration exceed a certain frequency, the reaction turns into a dynamic chain reaction and bursts into visible flames, whereas the flame is a manifestation of Light under the influence of the frequency which we perceive as heat. Vibration causes the omnipresent fiber of the domain of Light to contract and temporarily release Light-particles – manifestation of flames.



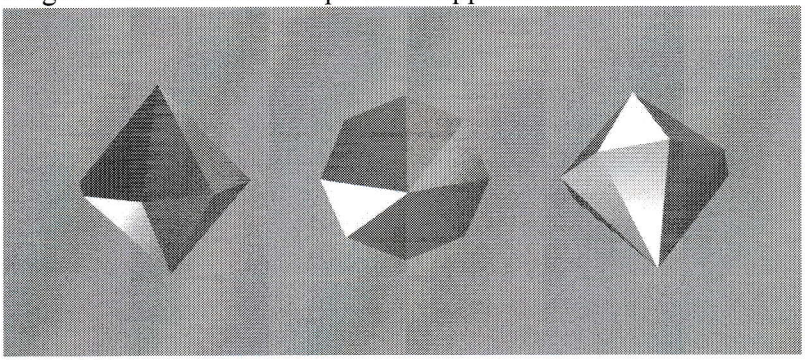
Pic.7 : manifestation of light particles

The frequency on our platform of Earth does not allow an interaction between Light and Darkness, however, this doesn't mean that Light cannot exist in our realm - this means that there is no interaction between the two elements, while Light can be fully present on Earth without interacting with our "physical" world. Light is the domain of the spiritual world around us which we cannot perceive. Although we cannot touch or sense the spiritual world around us in the traditional sense, the spiritual world is just as physical as ours, and it's the frequency down on Earth which separates the two domains. Light can exist in any form and color, just like the element Darkness. Technically, anything that exists as Darkness could exist in the form of Light.

*" His head and his hairs were white like wool, as white as snow; and **his eyes were as a flame of fire;"***

*"And his feet like unto fine brass, **as if they burned in a furnace**; and his voice as the sound of many waters. "*

John meets Christ in a vision: He describes him as having an appearance in the form of Light. Notice that he compares his appearance to flames.



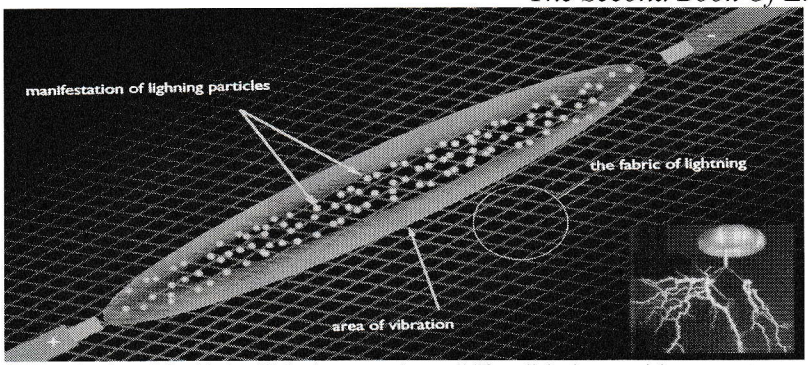
Pic.8 : Light-atoms

The Light-atom is most likely to have a octagonal base. Like in case of Darkness, atoms of Light differ in size and elongation, but have the same base.

The Domain of Lightning

„And for all my own heavens, I shaped the shape from the fiery substance. My eye looked at the solid and very hard rock. From the Flash of My Eye, I took the marvelous substance of Lightning, both fire in water and water in fire; neither does this one extinguish that one, nor does that one dry out this one. This is why Lightning is sharper and brighter than the shining of the sun, and softer than water, more solid than the hardest rock."

The Second Book Of Enoch

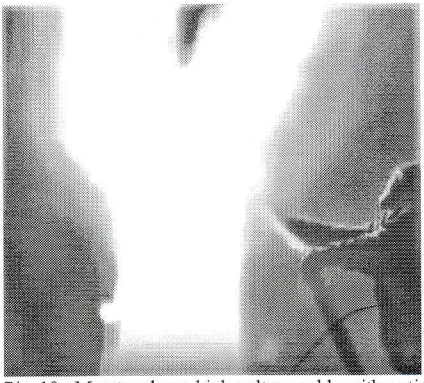


Pic. 9 : vibration of the fabric of lightning causes it to solidify to lightning particles

Like the previous elements, Lightning is also a self-sufficient element which manifests in the process of a contraction of its domain. We know the element

Lightning from electric sparks and from lightning bolts in the sky. Electric current is another form of vibration which causes the fabric of Lightning to temporarily contract and release small, geometric bubbles, also known as Lightning-particles. The element Lightning is not to be confused with the element Light. The light from lightning bolts is much brighter than the light from the Sun.

"lightning is sharper and brighter than the shining of the sun,..", "more solid than the hardest rock."



Pic. 10 : Man touches a high voltage cable with a stick and causes a temporary manifestation of lightning

Like the elements Light and Darkness, Lightning can appear in any shape and color, but is mostly known as blueish sparks. When we create an electric current, we thereby cause the fiber of the domain to contract and release bubbles which form a temporary, continuous spark. However, it's not the spark which conducts electricity, it's the electricity which causes a contraction of the fabric of Lightning thus causing Lightning particles to manifest.
When the current reaches a certain intensity, particles instantly manifest and expand, similarly to popcorn in a microwave, but on the atomic level, which creates a specific sound. The typical sound of electric sparks is created by a manifestation of Lightning particles.

"And for all my own heavens, I shaped the shape from the fiery substance....
I took the marvelous substance of lightning, both fire in water and water in fire;.."
It is said that Lightning is the element which God used to shape the highest heavens and the angels dwelling therein.

"From the rock, I cut off a great fire, and from the fire I created the ranks of the bodiless armies- ten myriad angels- their weapons are fiery, and their clothes are burning flames."

The Second Book Of Enoch

Angels are often described as having a shining appearance similar to a lightning bolt.

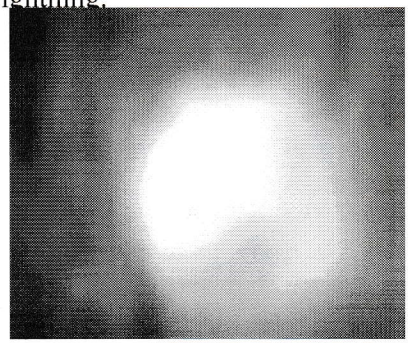
"And, behold, there was a great earthquake: for the angel of the Lord descended from heaven, and came and rolled back the stone from the door, and sat upon it.
His countenance was like lightning, and his raiment white as snow:
And for fear of him, the keepers did shake, and became as dead men."

Matthew 28 : 2-4

„And I saw ***other lightnings*** *and* ***the stars of heaven,*** *and I saw how He called them all by their names and they hearkened unto Him. ... (I saw) the width of their spaces and the day of their appearing, and how their revolution* ***produces lightning****: and (I saw) their revolution according to the number of the angels,"*

The Book Of Enoch 43 : 1-3

Stars, planets, and the Moon are made of Lightning. Moon's light is known to be cool . Cold light is another peculiarity of Lightning.

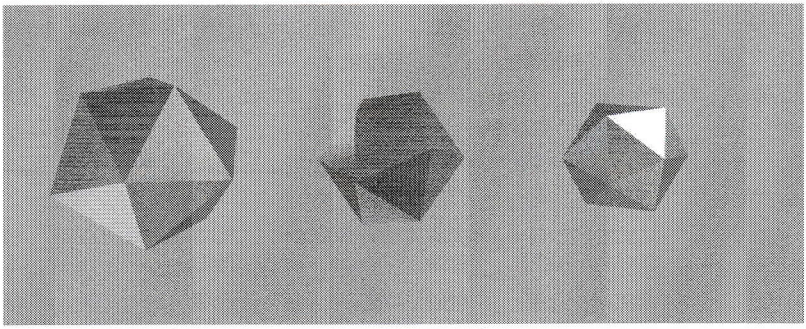


Pic.11 : a star zoomed in

Stars are made from the same material as the Moon and planets. If we zoom in on a twinkling star, we can see that it's not the same kind of light we observe in the Sun. Stars, planets, and the Moon resemble lightning bolts, as they are of the same element and radiate the same light.

Lightning is perhaps the most fascinating and *"marvelous"* element of all. Although the Idea that a substance like Lightning could be present in a solid form and in all different shapes and colors exceeds our imagination, technically, Lightning, Light, and Darkness are all self-sufficient elements. An object comprised of Lightning can be just as physical and permanently present as a usual rock comprised of Darkness, and we can see permanently present Lightning-objects in the sky for ourselves – Moon, stars, and planets.

Lightning is the element which interacts with our domain of Darkness. This is why we can see the stars and the Moon in the sky - because there is and interaction between Lightning and Darkness. If there was no interaction between the two elements, we wouldn't be able to see the Moon. In fact, we wouldn't see anything in the sky except the Sun, as the Sun is also comprised of Darkness.



Pic.12 : Lightning-atoms

Lightning atoms are most likely to be icosahedron-shaped. In the case of Lightning, atoms do not differ in elongation, like with the previous two elements, but in size alone. Lightning-atoms are "bubbles" of geometric shape which can only manifest and move within the domain of Lightning.

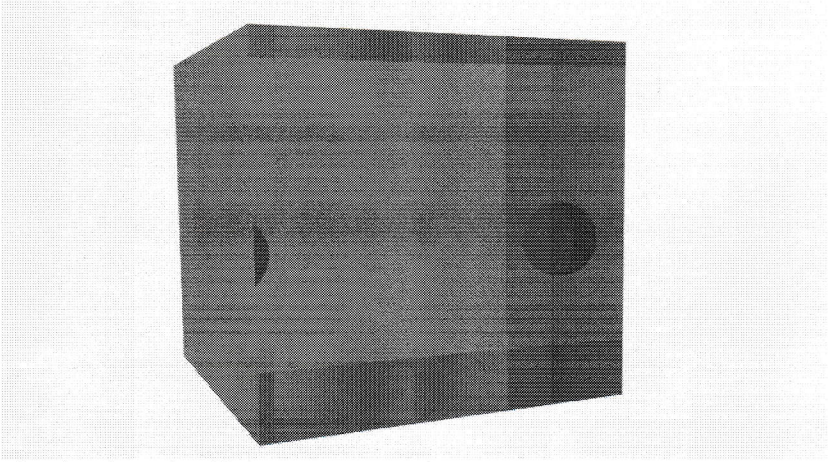
Repetitive Space and Propagation of Matter in Space

After having reviewed the domains of the elements, we can get to the next question : What is space? - Space is the cube-shaped domain which we have discussed in the previous title. Atoms can only manifest and move within their corresponding domain. We need to make a distinction between the domains and the aetherial body. The main purpose of the domains is to provide the geometric bubbles, also known as atoms. By contracting and releasing bubbles, the domain has met its main and sole purpose. At this point, we have matter in a present form, yet the mere presence of matter does not provide any of the known properties of matter. After manifesting in the form of geometric bubbles, matter is being picked up by the aether, and receives all of its properties, including weight and magnetism, from the aether. Since the aetherial body is in a constant high-frequency vibration, atoms strive downwards, towards the pillars of the Earth below, as that is where the vibration is coming from.

"If you want to find the secrets of the universe, think in terms of energy, frequency and vibration."

Nicola Tesla

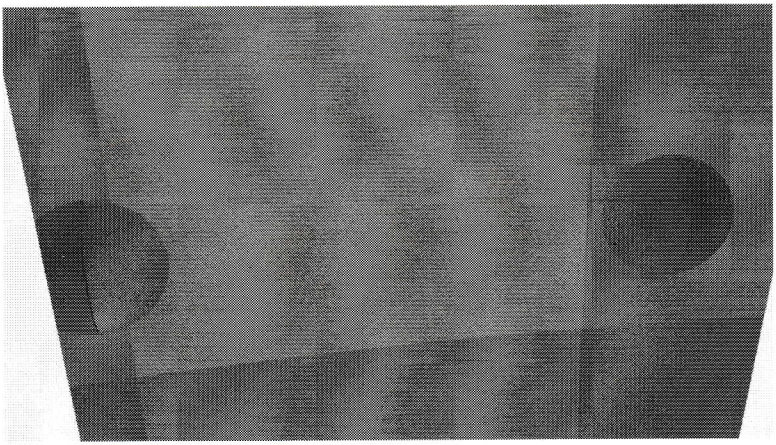
Now let's get back to the question about space. Space as we know it is the domain as described earlier. In order to understand how cyclic space is physically possible, we need to keep in mind that matter is not expressed in the "bubble", but in the medium surrounding the bubble, while the bubble itself is technically the absence of matter and a hollow space within the domain. The bubble can appear at any point within the domain, since the actual element is the medium itself. The domains have the property to act as a continuous, repetitive space that has no perceptible boundaries. A bubble that reaches the "wall" of the domain and continues its journey passes through it and appears at the opposite "wall". From the perspective of the bubble, the domain acts as a continuum, and the bubble wouldn't notice its jump to the opposite wall. Matter is in fact the medium itself, whereas atoms are bubbles which are not bound to a specific point within the domain, but can be projected to any point within the medium. A bubble can move in a straight line perpetually, without ever reaching the "wall", since it would start its motion anew every time it passes through the wall without experiencing the wall as an obstacle. Moreover, the bubble wouldn't be able to tell the exact location of the wall within the domain, since the illusion of continuity is perfect. People, airplanes, and ships are constantly crossing the "wall" of the domain in the extreme West, and continue their journey in the extreme East of the domain without being aware of the "jump". This is the principle which enables to travel from east to west or from west to east and arrive at the starting point, all while moving in a straight line over a flat plane.



Pic.13 : a domain and a moving object.

Picture 13 shows a domain and a spherical object moving from right to left. Let's imagine that this is the domain of Darkness and the object is a ball. The

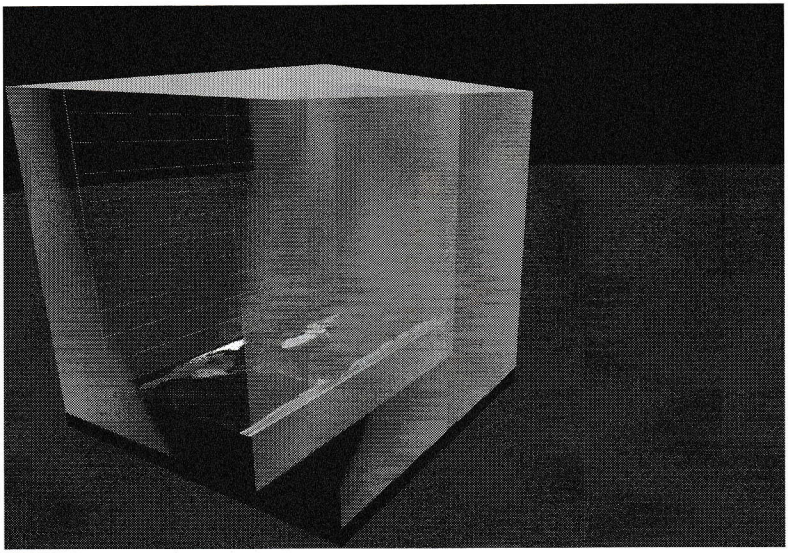
ball is moving from right to left in a repetitive cycle; as soon as it reaches the left wall, it appears at the right wall. The cube-shaped box represents the medium in which the ball exists. The ball cannot leave the box, nor find its edge. In likewise manner, our known space is the cube and we are the ball.



Pic.14

Picture 14 : The ball moving from right to left in a continuous space loop.

Summary :



Pic.15

We have learned that there is a foundation below; that there are two Foundations of Heaven, and that there are three domains simultaneously occupying the same space. Picture 15 shows a cube-shaped universe resting upon a foundation. The white cube shows our known space, since all three domains are resting upon the foundation. Aside from the domains, there is an aethereal body which permeates the domains, and distributes the high-frequency vibration of the pillars below throughout the entire created universe – the universe is the domain. All forces, including "gravity", magnetism, electromagnetism, electricity - to name a few, are nothing but aethereal vibration.

The Earth occupies one of the platforms between the Foundations of Heaven. We can travel from east to west or from west to east in a repetitive space continuum and come back to where we started while moving over a flat surface, as that is how our domain works. The motion in our repetitive space can be compare to the motion on a sphere – in both cases, the traveler will never reach the "edge".
